Guided Exercises

Part 1: Evaluate a Security Policy

2. **Evaluate** the policy document against the NIST best practices summarized above. **Identify by number** which, if any, of the eight best practices the policy satisfies. For each practice that you identify, **provide a reference** to the statement in the policy that aligns with that best practice.

Fails with newer standards like breach checks, no expiration, and no complexity rules.

3. **Suggest** how you would revise the policy to directly align with the standards. **Provide specific statements** that you would add/modify in the policy.

passwords must be changed every 90 days, not be identical to any of the last 10 passwords.

4. **Describe** whether this document is best titled as a policy or whether it would be better described using another element of the policy framework.

Best described as a password policy. Must be enforced for maximum security.

Part 2: Review a Security Configuration Standard

3. **Describe** the process that the Center uses to ensure that its standards represent the consensus of the cybersecurity community.

Updating standards for new threats, collaborating with cybersecurity experts, and review/validating recommendations based on consensus.

5. **Identify** the section of the recommendations that achieves this goal.

Section 1.1

7. For each of the five best practices in the previous step, **classify** the practice as:

- Satisfied (indicate recommendation number that achieves the best practice)
- Violated (indicate recommendation number that violates the best practice)
- Not addressed

Satisfied, satisfied, violated, violated, satisfied.

Challenge Exercise

Select three specific statements included in the standard that you drew from your own experience that are covered by the industry best practice document that you selected. For each of these three statements:

- **Identify** the section of your standard.
- **Identify** the section of the industry best practices that covers the same topic.
- **Identify** whether the standard you selected satisfies or violates the industry best practice.
- **Provide** a rationale for your conclusion.

Standard: Cisco VPN configuration
Best Practices: NIST SP 800, Remote Access, Bring Your Own Device Security.
Somewhat satisfies industry best practice for remote work safety and authentication. Reliable authentication but adding MFA would further enhance the security, the VPN sessions ensure productivity, and with minor adjustments can fully meet NIST standards.
