Chapter 5 Project - John the Ripper + Hackme.txt

Project Reflection

This project allowed me to see what password cracking tools like John the Ripper are like, it allows you to recover passwords from hashed values by guessing the original password. I did a dictionary attack by searching for the word password because it is such a common password, and it shows how easily such passwords can be cracked. These along with brute forcing shows how important it is to have a strong password. Passwords with numbers only or letters only will never be safe, and that's why most companies ask for a combination of both and most of the time an additional special character.

Screenshot #1

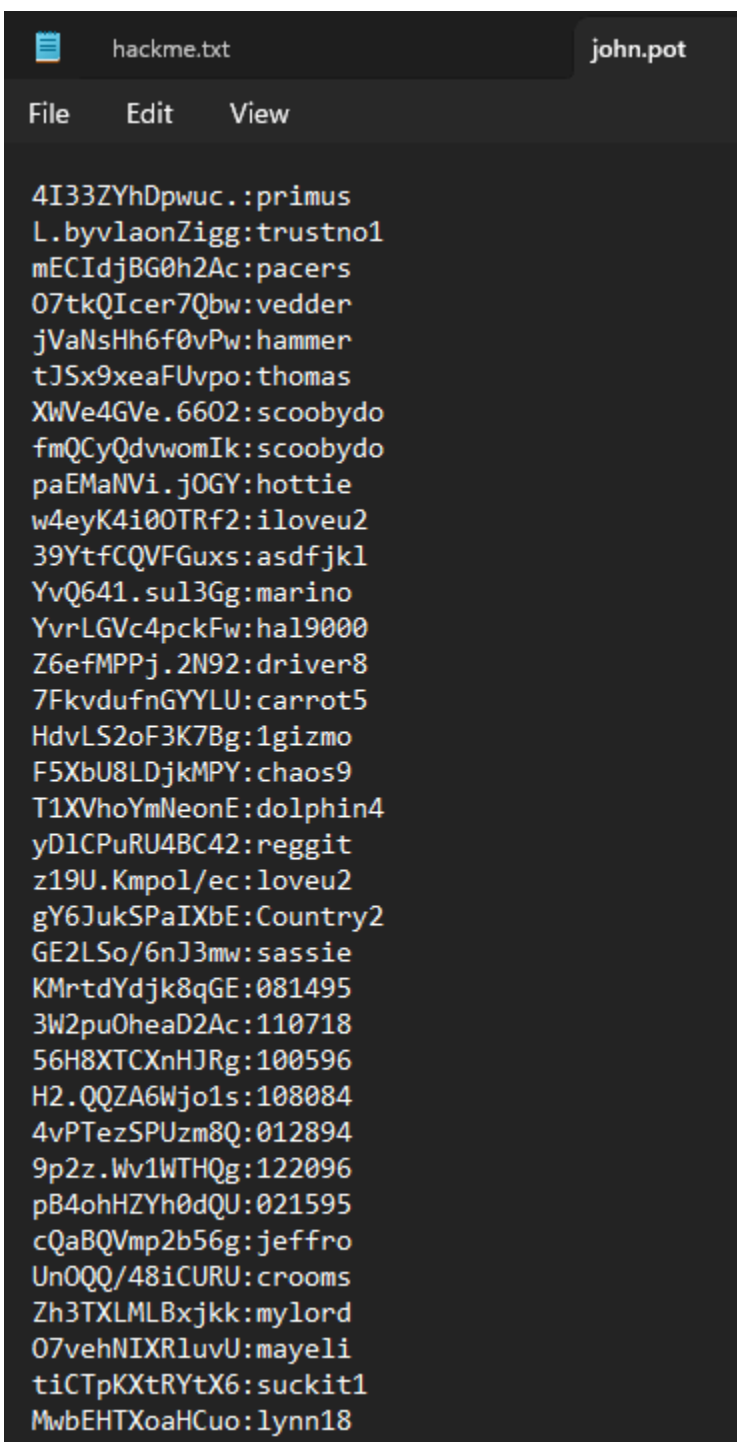

```
C:\Users\Ahmad\Documents\Security\john-1.9.0-jumbo-1-win64\john-1.9.0-jumbo-1-win64\run>john.exe --wordlist=password.lst hackme.txt
Warning: detected hash type "descrypt", but the string is also recognized as "descrypt-opencl"
Use the "--format=descrypt-opencl" option to force loading these as that type instead
Using default input encoding: UTF-8
Loaded 584 password hashes with 127 different salts (descrypt, traditional crypt(3) [DES 256/256 AVX2])
Will run 16 OpenMP threads
Press 'q' or Ctrl-C to abort, almost any other key for status
Warning: Only 3542 candidates left, minimum 4096 needed for performance.

Screenshot #3

A screenshot of a text editor window with a dark theme. The window has two tabs: 'hackme.txt' and 'john.pot'. The 'john.pot' tab is active. The menu bar shows 'File', 'Edit', and 'View'. The text content consists of a list of usernames and passwords separated by colons, one per line. The text is as follows:

```
